

### **FOURIER TRANSFORM**

• Fourier transform decompose signal into its frequency component

### DISCRETE-TIME FOURIER TRANSFORM

 A linear and time-invariant system can be represented using its response to the unit sample sequence that

$$x(n) \longrightarrow h(n) \longrightarrow y(n) = h(n) * x(n)$$

 A linear and time-invariant system can be represented using the complex exponential signal set

$$\{e^{j\omega n}\}$$

### DISCRETE-TIME FOURIER TRANSFORM

General form of DTFT

$$X(e^{j\omega}) \triangleq \mathcal{F}[x(n)] = \sum_{n=-\infty}^{\infty} x(n)e^{-j\omega n}$$

• The inverse discrete-time Fourier transform (IDTFT) of  $X(e^{j\omega})$  is given by

$$x(n) \triangleq \mathcal{F}^{-1} \left[ X(e^{j\omega}) \right] = \frac{1}{2\pi} \sum_{-\pi}^{\pi} X(e^{j\omega}) e^{j\omega n} d\omega$$

### DISCRETE-TIME FOURIER TRANSFORM

• The operator  $\mathcal{F}[.]$  transforms a discrete signal x(n) into a complex-valued continuous function  $X(e^{j\omega})$  of real variable  $\omega$ , called a digital frequency, which is measured in radians/sample

- Determine the discrete-time Fourier transform of  $x(n) = (0.5)^n u(n)$ .
- The sequence x(n) is absolutely summable; therefore its discrete-time Fourier transform exists.

$$X(e^{j\omega}) = \sum_{-\infty}^{\infty} x(n)e^{-j\omega n} = \sum_{0}^{\infty} (0,5)^{n} e^{-j\omega n}$$
$$= \sum_{0}^{\infty} (0,5e^{-j\omega})^{n} = \frac{1}{1 - 0.5e^{-j\omega}} = \frac{e^{j\omega}}{e^{j\omega} - 0.5}$$

### THE GEOMETRIC SERIES

A one-sided exponential sequence of the form

$$\{\alpha^n, n\geq 0\}$$

• The series converges for |a| < 1, while the sum of its components converges to

$$\sum_{n=0}^{\infty} \alpha^n \to \frac{1}{1-\alpha}, \quad \text{for } |\alpha| < 1$$

# **DTFT PAIRS**

Signal Type	Sequence $x(n)$	) DTFT $X(e^{j\omega}), -\pi \le \omega \le \pi$
Unit impulse	$\delta(n)$	1
Constant	1	$2\pi\delta(\omega)$
Unit step	u(n)	$\frac{1}{1 - e^{-j\omega}} + \pi \delta(\omega)$
Causal exponential	$\alpha^n u(n)$	$rac{1}{1-lpha e^{-j\omega}}$
Complex exponential	$e^{j\omega_0 n}$	$2\pi\delta(\omega-\omega_0)$
Cosine	$\cos(\omega_0 n)$	$\pi[\delta(\omega-\omega_0)+\delta(\omega+\omega_0)]$
Sine	$\sin(\omega_0 n)$	$j\pi[\delta(\omega+\omega_0)-\delta(\omega-\omega_0)]$
Double exponential	$\alpha^{ n }u(n)$	$\frac{1 - \alpha^2}{1 - 2\alpha\cos(\omega) + \alpha^2}$

• Linearity: The discrete-time Fourier transform is a linear transformation

$$\mathcal{F}\left[\alpha x_1(n) + \beta x_2(n)\right] = \alpha \mathcal{F}\left[x_1(n)\right] + \beta \mathcal{F}\left[x_2(n)\right]$$

- for every  $\alpha$ ,  $\beta$ ,  $x_1(n)$ , and  $x_2(n)$ .
- Time shifting: A shift in the time domain corresponds to the phase shifting.

$$\mathcal{F}\left[x(n-k)\right] = X(e^{j\omega})e^{-j\omega k}$$

• Frequency shifting: Multiplication by a complex exponential corresponds to a shift in the frequency domain

$$\mathcal{F}\left[x(n)e^{j\omega_{o}n}\right] = X\left(e^{j(\omega-\omega_{o})}\right)$$

• Conjugation: Conjugation in the time domain corresponds to the folding and conjugation in the frequency domain

$$\mathcal{F}\left[x^*(n)\right] = X^*(e^{-j\omega})$$

 Folding: Folding in the time domain corresponds to the folding in the frequency domain

$$\mathcal{F}\left[x(-n)\right] = X\left(e^{-j\omega}\right)$$

 Symmetries in real sequences: We have already studied the conjugate symmetry of real sequences. These real sequences can be decomposed into their even and odd parts

$$x(n) = x_e(n) + x_o(n)$$

$$\mathcal{F}\left[x_{e}(n)\right] = \operatorname{Re}\left[X\left(e^{j\omega}\right)\right] \qquad \qquad \mathcal{F}\left[x_{o}(n)\right] = j\operatorname{Im}\left[X\left(e^{j\omega}\right)\right]$$

 Convolution: This is one of the most useful properties that makes system analysis convenient in the frequency domain

$$\mathcal{F}\left[x_{1}(n) * x_{2}(n)\right] = \mathcal{F}\left[x_{1}(n)\right] \mathcal{F}\left[x_{2}(n)\right] = X_{1}(e^{j\omega}) X_{2}(e^{j\omega})$$

Multiplication: This is a dual of the convolution property

$$\mathcal{F}\left[x_{1}(n)\cdot x_{2}(n)\right] = \mathcal{F}\left[x_{1}(n)\right] \circledast \mathcal{F}\left[x_{2}(n)\right]$$

$$\triangleq \frac{1}{2\pi} \int_{-\pi}^{\pi} X_{1}(e^{j\theta}) X_{2}(e^{j\omega-\theta}) d\theta$$

This convolution-like operation is called a *periodic convolution* and hence denoted by \*

• **Energy**: The energy of the sequence x(n) can be written as

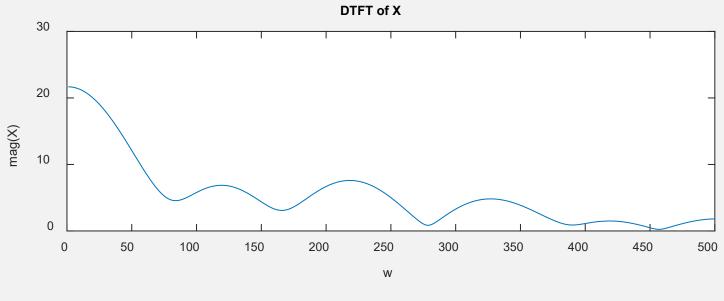

$$\varepsilon_{x} = \sum_{-\infty}^{\infty} |x(n)|^{2} = \frac{1}{2\pi} \int_{-\pi}^{\pi} |X(e^{j\omega})|^{2} d\omega$$
$$= \int_{0}^{\pi} \frac{|X(e^{j\omega})|^{2}}{\pi} d\omega$$

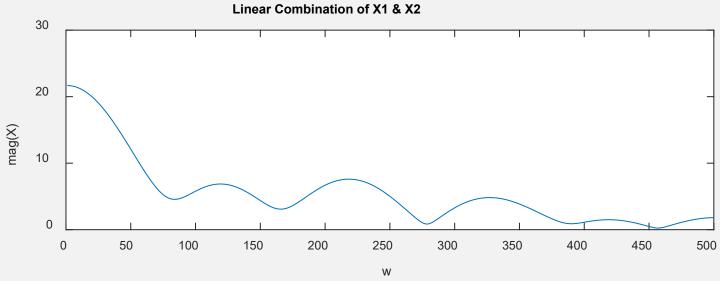

Verify the linearity property of DTFT using real-valued finite duration sequences

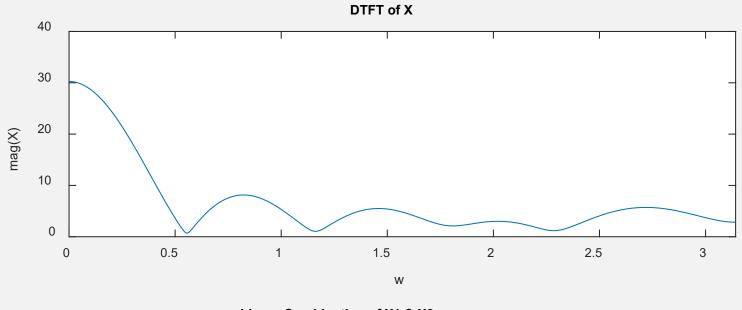

$$\mathcal{F}\left[\alpha x_1(n) + \beta x_2(n)\right] = \alpha \mathcal{F}\left[x_1(n)\right] + \beta \mathcal{F}\left[x_2(n)\right]$$

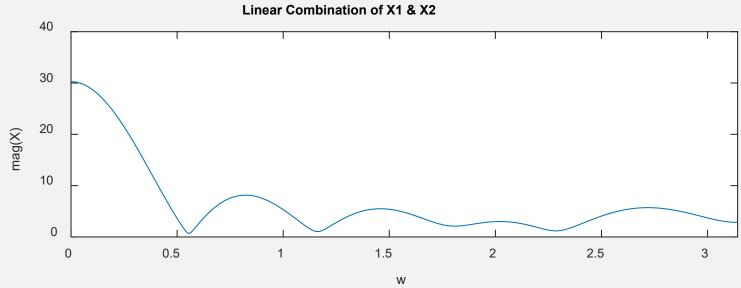

• Which  $x_1(n)$  and  $x_2(n)$  are two random sequences uniformly distributed between [0, 1] over  $0 \le n \le 10$ .

```
>> x1 = rand(1,11); x2 = rand(1,11); n = 0:10;
>> alpha = 2; beta = 3; k = 0:500; w = (pi/500)*k;
>> X1 = x1 * (exp(-j*pi/500)).^(n'*k); % DTFT of x1
>> X2 = x2 * (exp(-j*pi/500)).^(n'*k); % DTFT of x2
>> x = alpha*x1 + beta*x2; % Linear combination of x1 & x2
>> X = x * (exp(-j*pi/500)).^(n'*k); % DTFT of x
>> % verification
>> X check = alpha*X1 + beta*X2; % Linear Combination of X1 & X2
>> error = max(abs(X-X check)) % Difference
error = 7.1054e - 015
```

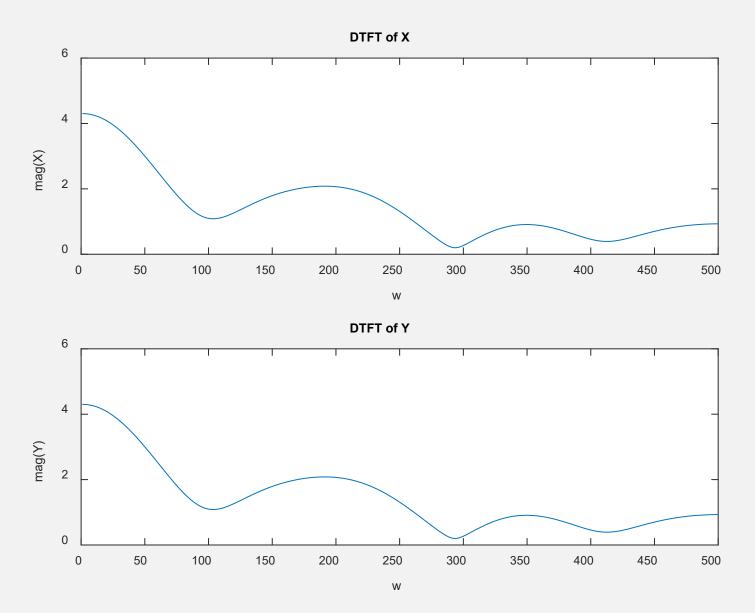

Verify the sample shift property

$$\mathcal{F}\left[x(n-k)\right] = X(e^{j\omega})e^{-j\omega k}$$

• which x(n) is a random sequence uniformly distributed between [0, 1] over  $0 \le n \le 10$  and let y(n) = x(n-2).

```
>> x = rand(1,11); n = 0:10;
>> k = 0:500; w = (pi/500)*k;
>> X = x * (exp(-j*pi/500)).^(n'*k); % DTFT of x
>> % signal shifted by two samples
>> y = x; m = n+2;
>> Y = y * (exp(-j*pi/500)).^(m'*k); % DTFT of y
>> % verification
>> Y_check = (exp(-j*2).^w).*X; % multiplication by exp(-j2w)
>> error = max(abs(Y-Y_check)) % Difference
error =5.7737e-015
```

Verify the frequency shift property

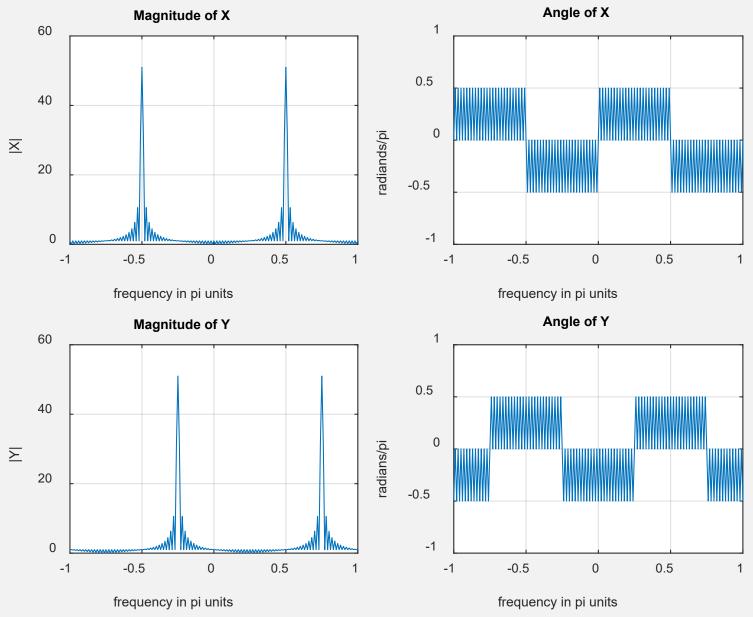

$$\mathcal{F}\left[x(n)e^{j\omega_{o}n}\right] = X\left(e^{j(\omega-\omega_{o})}\right)$$

Which

$$x(n) = \cos(\pi n/2), \quad 0 \le n \le 100$$
$$y(n) = e^{j\pi n/4}x(n)$$

```
>> n = 0:100; x = cos(pi*n/2);
>> k = -100:100; w = (pi/100)*k; % frequency between -pi and +pi
>> X = x * (exp(-j*pi/100)).^(n'*k); % DTFT of x
>> y = exp(j*pi*n/4).*x; % signal multiplied by exp(j*pi*n/4)
>> Y = y * (exp(-j*pi/100)).^(n'*k); % DTFT of y
```

```
% Graphical verification
>>  subplot(2,2,1); plot(w/pi,abs(X)); grid; axis([-1,1,0,60])
>> xlabel('frequency in pi units'); ylabel('|X|')
>> title ('Magnitude of X')
>> subplot(2,2,2); plot(w/pi,angle(X)/pi); grid; axis([-1,1,-1,1])
>> xlabel('frequency in pi units'); ylabel('radiands/pi')
>> title('Angle of X')
>> subplot(2,2,3); plot(w/pi,abs(Y)); grid; axis([-1,1,0,60])
>> xlabel('frequency in pi units'); ylabel('|Y|')
>> title('Magnitude of Y')
>> subplot(2,2,4); plot(w/pi,angle(Y)/pi); grid; axis([-1,1,-1,1])
>> xlabel('frequency in pi units'); ylabel('radians/pi')
>> title('Angle of Y')
```

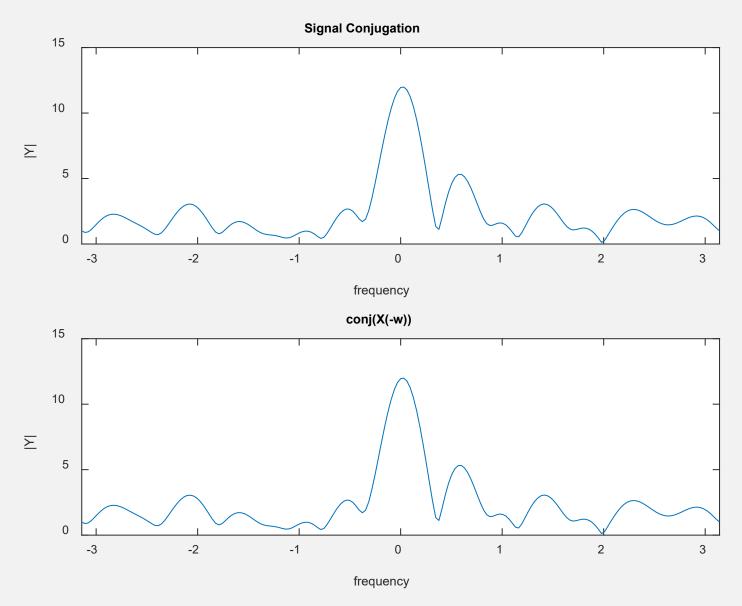

Verify the conjugation property

$$\mathcal{F}\left[x^*(n)\right] = X^*(e^{-j\omega})$$

• Which x(n) is a complex-valued random sequence over  $-5 \le n \le 10$  with real and imaginary parts uniformly distributed between [0, 1]

```
>> n = -5:10; x = rand(1, length(n)) + j*rand(1, length(n));
>> k = -100:100; w = (pi/100)*k; % frequency between -pi and +pi
>> X = x * (exp(-j*pi/100)).^(n'*k); % DTFT of x
% conjugation property
>> y = conj(x); % signal conjugation
>> Y = y * (exp(-j*pi/100)).^(n'*k); % DTFT of y
% verification
>> Y check = conj(fliplr(X)); % conj(X(-w))
>> error = max(abs(Y-Y check)) % Difference
error = 0
```

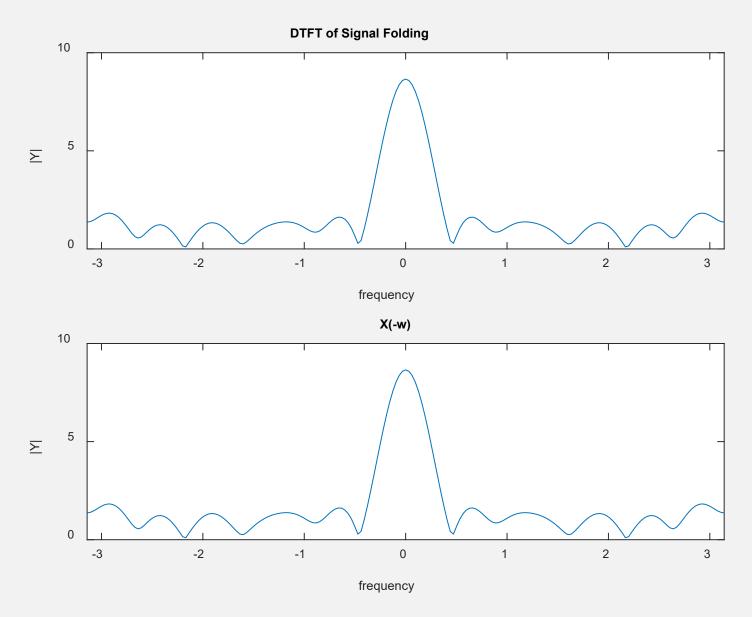

Verify the folding property

$$\mathcal{F}\left[x(-n)\right] = X\left(e^{-j\omega}\right)$$

• Which x(n) be a random sequence over  $-5 \le n \le 10$  uniformly distributed between [0, 1].

```
>> n = -5:10; x = rand(1, length(n));
>> k = -100:100; w = (pi/100)*k; % frequency between -pi and +pi
>> X = x * (exp(-j*pi/100)).^(n'*k); % DTFT of x
% folding property
>> y = fliplr(x); m = -fliplr(n); % signal folding
>> Y = y * (exp(-j*pi/100)).^(m'*k); % DTFT of y
% verification
>> Y check = fliplr(X); % X(-w)
>> error = max(abs(Y-Y check)) % Difference
error = 0
```

Verify the symmetry property of real signals

$$x(n) = x_e(n) + x_o(n)$$

$$\mathcal{F}\left[x_{e}\left(n\right)\right] = \operatorname{Re}\left[X\left(e^{j\omega}\right)\right] \qquad \qquad \mathcal{F}\left[x_{o}\left(n\right)\right] = j\operatorname{Im}\left[X\left(e^{j\omega}\right)\right]$$

• Which  $x(n) = \sin(\pi n/2), -5 \le n \le 10$ 

```
>> n = -5:10; x = sin(pi*n/2);
>> k = -100:100; w = (pi/100)*k; % frequency between -pi and +pi
>> X = x * (exp(-j*pi/100)).^(n'*k); % DTFT of x
% signal decomposition
>> [xe, xo, m] = evenodd(x, n); % even and odd parts
>> XE = xe * (\exp(-j*pi/100)).^{(m'*k)}; % DTFT of xe
>> XO = xo * (\exp(-j*pi/100)).^{(m'*k)}; % DTFT of xo
% verification
>> XR = real(X); % real part of X
>> error1 = max(abs(XE-XR)) % Difference
error1 = 1.8974e-019
>> XI = imag(X); % imag part of X
```

```
>> error2 = max(abs(XO-j*XI)) % Difference
error2 = 1.8033e-019
% graphical verification
>> subplot(2,2,1); plot(w/pi,XR); grid; axis([-1,1,-2,2])
>> xlabel('frequency in pi units'); ylabel('Re(X)');
>> title('Real part of X')
>> subplot(2,2,2); plot(w/pi,XI); grid; axis([-1,1,-10,10])
>> xlabel('frequency in pi units'); ylabel('Im(X)');
>> title('Imaginary part of X')
```

```
>> subplot(2,2,3); plot(w/pi,real(XE)); grid; axis([-1,1,-2,2])
>> xlabel('frequency in pi units'); ylabel('XE');
>> title('Transform of even part')
>> subplot(2,2,4); plot(w/pi,imag(XO)); grid; axis([-1,1,-10,10])
>> xlabel('frequency in pi units'); ylabel('XO');
>> title('Transform of odd part')
```
